# **MOCKITO EXERCISES**

## **Exercise 1: Mocking and Stubbing**

Scenario: You need to test a service that depends on an external API. Use Mockito to mock the external API and stub its methods.

#### **SOLUTION:**

Step 1:Add the Dependency in pom.xml.

### **CODE:**

```
project xmlns="http://maven.apache.org/POM/4.0.0"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="http://maven.apache.org/POM/4.0.0 https://maven.apache.org/xsd/maven-

Step 2:Create a mock object for the external API.

# **CODE** (for ExternalApi.java):

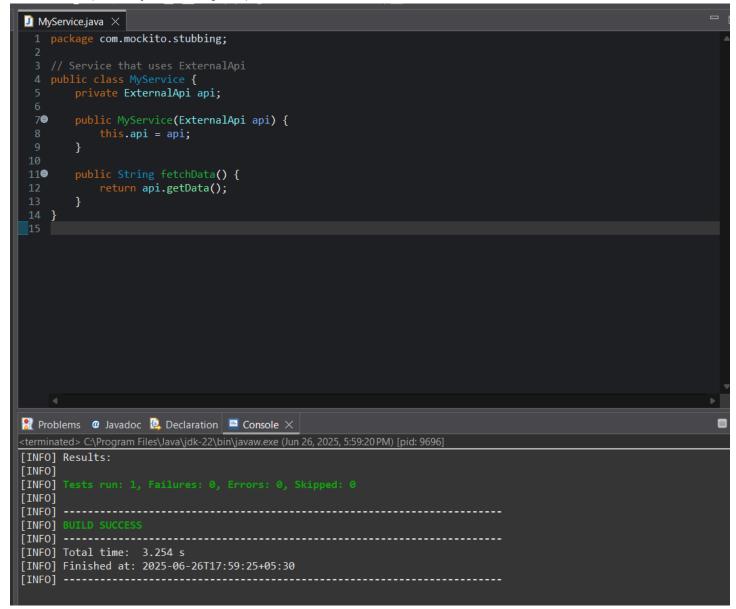

```
package com.mockito.stubbing;
public interface ExternalApi {
   String getData();
   String getData1();
}
```

## **OUTPUT(for ExternalApi.java):**

# **CODE(for MyService.java):**

```
package com.mockito.stubbing;
// Service that uses ExternalApi
public class MyService {
    private ExternalApi api;
    public MyService(ExternalApi api) {
        this.api = api;
    }
    public String fetchData() {
        return api.getData();
    }
}
```

## **OUTPUT(for MyService.java):**

Step 3&4: Stub the methods to return predefined values. Write a test case that uses the mock object.

# **CODE**(for TestCase.java):

```
package com.mockito.stubbing;

// Needed for assertEquals
import static org.junit.jupiter.api.Assertions.*;
import static org.mockito.Mockito.*;
import org.junit.jupiter.api.Test;
import org.mockito.Mockito;

// Test class
public class TestCase {
```

```
@Test
public void testExternalApi() {
    // Create a mock for the ExternalApi
    ExternalApi mockApi = Mockito.mock(ExternalApi.class);
    // Stub the getData() method
    when(mockApi.getData()).thenReturn("Mock Data");
    // Inject mock into MyService
    MyService service = new MyService(mockApi);
    // Call the method under test
    String result = service.fetchData();
    // Assert the result
    assertEquals("Mock Data", result);
}
```

### **OUTPUT(for TestCase.java):**

             MyService service = new MyService(mockApi);
